the electrical trucks, the contractor trucks, the carpet cleaners, window installers, etc. No matter what happens, people always need those basic services. The electric power delivery system that carries electricity from

Access Free Electrical Power

large central generators to customers could be severely damaged by a small number of well-informed attackers. The system is inherently vulnerable because transmission lines may span hundreds of miles, and many key facilities are unguarded. This vulnerability is exacerbated by the fact that the power grid,

Access Free Electrical Power

most of which was originally designed to meet the needs of individual vertically integrated utilities, is being used to move power between regions to support the needs of competitive markets for power generation.

Primarily because of ambiguities introduced as a result of recent restricting the of the

Access Free Electrical Power

Engineering cost pressures from consumers and regulators, investment to strengthen and upgrade the grid has lagged, with the result that many parts of the bulk high-voltage system are heavily stressed.

Electric systems are not designed to withstand or quickly recover from damage inflicted

Access Free Electrical Power

simultaneously on multiple components. Such an attack could be carried out by knowledgeable attackers with little risk of detection or interdiction. Further well-planned and coordinated attacks by terrorists could leave the electric power system in a large region of the country at least partially disabled for a

very long time.

Although there are many examples of terrorist and military attacks on power systems elsewhere in the world, at the time of this study international terrorists have shown limited interest in attacking the U.S. power grid. However, that should not be a basis for complacency. Because

Access Free Electrical Power

all parts of the economy, as well as human health and welfare, depend on electricity, the results could be devastating.

Terrorism and the Electric Power Delivery System focuses on measures that could make the power delivery system less vulnerable to attacks, restore power faster after an attack, and make critical

services less vulnerable
while the delivery of
conventional electric
power has been
disrupted.
